

Task site	Operation	Earliest service start, r_i (min)	Latest service completion, D_i (min)	Service duration, σ_i (min)	Feasible service-start interval, $[r_i, D_i - \sigma_i]$ (min)
 001	Drilling	840	930	65.8	[840, 864.2]
 003	Detection	40	80	18.5	[40, 61.5]
 004	Sampling	540	610	41.4	[540, 568.6]
 006	Detection	40	140	12.8	[40, 127.2]
 007	Drilling	830	900	47.4	[830, 852.6]
 009	Sampling	530	630	30.4	[530, 599.6]
 018	Sampling	370	430	30.8	[370, 399.2]

Note: Times are measured from the beginning of the fixed mission horizon ($H^{\text{mis}} = 1680$ min). Because waiting at task sites is prohibited, service must start within $[r_i, D_i - \sigma_i]$.
